

Sudoku NRM v2n18

Test your brain power with NRM's Sudoku

The only rule to play this game is each row, column and box contain the digits 1, 2, 3, 4, 5, 6, 7, 8 and 9.

- Each of the nine rows is nine cells wide and must contain only one each of the numbers.
- The same is true with the nine columns. One of each digit must fit into each of the column's nine cells.
- The third unit, the region, is a three-cell-by-three-cell subgrid. The nine boxes must also contain one of every number, and again, they cannot be repeated.
- There is only one solution to every puzzle, and you can't change the numbers already included in the grid.
